Software Setup – The New Cloud You’ve probably heard about the cloud — the new way of doing business. All of a sudden, software upgrades are easier than ever. Roll out a new app to your clients in less time than it takes to download an update. No more waiting for upgrades to download, just go to your client’s site and start working. New functionality is a snap to provide. The cloud has gained widespread acceptance, and companies like Microsoft, Google, Apple and others have all jumped on board. Even developers, who are notoriously resistant to change, are embracing the cloud and cloud development tools. The good news is that these new tools make it easier to create software. Not only are the development times shorter, but the cloud tools can also speed up the final delivery. So how does the cloud work? In essence, the cloud consists of three parts: A central server where your apps and data live. For example, Google Drive, Dropbox or Amazon Web Services (AWS). A development environment, which provides you with a virtual machine or sandbox where you can test your app. This environment is accessed through a browser on your machine. Your apps can be written in HTML, CSS and JavaScript (Javascript), an open standard for web development. Because the apps run in this virtual machine, they run just like any other website, so they can be tested on different browsers. The server provides your app with the necessary data as it runs. While the cloud still has a bit of a learning curve, its benefits are starting to be seen in the real world. What’s the future of software development? Amazon offers a service called AWS which allows you to create a virtual server. Then you can test apps and create projects in that server. This virtual machine can be spun up whenever you need to test your app. When you are ready, you can then shut down the server and move it into your production server. In this way, you don’t have to worry about testing in your production server. You
